

LAB WORKSHEET

Lab 4 — Shared Storage: NAS (NFS / CIFS) and SAN (iSCSI)

Name	_____	Date	_____
------	-------	------	-------

Objective: 1.2 — Shared storage: NAS (NFS, CIFS), SAN (iSCSI, Fibre Channel, FCoE).

Work through the lab on the Killercoda Ubuntu playground and record your results below.

Task 1 — NFS share

Export and mount an NFS share on the loopback.

Paste showmount -e output and the readme contents from the mount.

Task 2 — CIFS/SMB share

Add a Samba [lab] share and list it with smbclient.

Paste the smbclient -L listing.

Task 3 — iSCSI target

Build the tgt target and confirm it.

Paste tgtadm --mode target --op show LUN line.

Task 4 — iSCSI initiator

Discover, log in, then format and mount the LUN.

Record the new /dev/sdX name and df -h /mnt/san.

Task 5 — NAS vs SAN

Explain why the iSCSI LUN must be formatted by the client but the NFS share is not.

Write one sentence contrasting file vs. block access.

Completion checklist

- Exported and mounted an NFS file share.
- Served a CIFS/SMB share and listed it with smbclient.
- Built an iSCSI target with tgt.
- Connected the initiator and formatted the LUN as block storage.
- Explained where FC/FCoE fit relative to iSCSI.
