

LAB WORKSHEET

Lab 5 — Out-of-Band Management, BIOS/UEFI, and Firmware

Name	_____	Date	_____
------	-------	------	-------

Objective: 1.3 — Server hardware maintenance: out-of-band management, IP KVM, BIOS/UEFI, firmware, hot-swap.

Work through the lab on the Killercoda Ubuntu playground and record your results below.

Task 1 — Boot mode

Determine whether the host booted UEFI or legacy BIOS and read the BIOS version.

Record the boot mode and BIOS version/date.

Task 2 — IPMI mapping

Map three ipmitool subcommands to Server+ OOB sub-objectives.

List command -> objective for power, console and audit.

Task 3 — Firmware inventory

Run fwupdmgr get-devices and refresh.

Note one device with available firmware and the change-management steps you would follow.

Task 4 — Local admin paths

List the four ways into a server when OOB is down.

Name crash cart, KVM, serial, virtual console with one use each.

Task 5 — Hot-swap drill

Walk the hot-swap checklist for a failed drive.

Write the five pre-swap checks in order.

Completion checklist

- Identified UEFI vs. legacy boot and the BIOS version.
- Mapped the ipmitool command set to OOB sub-objectives.
- Ran the fwupd firmware inventory and update workflow.
- Listed the four local-admin access paths.
- Completed the hot-swap pre-swap checklist.
