

LAB WORKSHEET

Lab 9 — Server Firewall and Port Management

Name		Date	
------	-------------	------	-------------

Objective: 2.2 / 3.5 — Firewall and port management: default-deny, source-restricted rules, close unneeded ports.

Work through the lab on the Killercode Ubuntu playground and record your results below.

Task 1 — Open port

Start nginx and confirm its listening port.

Paste `ss -tlnp | grep nginx` and the `nmap -p80` result.

Task 2 — Default-deny

Reset UFW and apply default-deny with allows for 22/80/443.

Paste `ufw status verbose`.

Task 3 — Verify policy

`nmap` the host for 22,23,25,80,443,3306.

Record which ports are open vs. filtered.

Task 4 — Source-restricted

Allow MySQL only from 10.99.99.0/24.

Paste the numbered rule.

Task 5 — Three-view audit

Compare `ss`, `nmap` and `ufw` status.

Confirm the three views agree, or note the gap.

Completion checklist

- Recited the well-known Server+ port table.
- Applied a default-deny UFW policy with explicit allows.
- Added a source-restricted (CIDR) rule.
- Translated a UFW rule to nftables.
- Reconciled listening vs. reachable vs. permitted.
