

LAB WORKSHEET

Lab 12 — Performance Monitoring, Baselining, Event Logs

Name		Date	
------	-------------	------	-------------

Objective: 2.3 — Monitoring: uptime, thresholds, IOPS, capacity vs. utilisation, event logs, alerting, baselining.

Work through the lab on the Killercoda Ubuntu playground and record your results below.

Task 1 — CPU + memory

Capture CPU and memory baselines.

Record idle %, iowait % and available memory.

Task 2 — Disk IOPS

Run fio then read iostat.

Record %util, IOPS (r/s+w/s) and await.

Task 3 — Baseline file

Write the combined baseline file.

Paste ls of /var/log/baseline and note the capture date.

Task 4 — Log rotation

Inspect logrotate policy and journal errors.

Note the default retention and one error entry.

Task 5 — Threshold alert

Scrape node_exporter and write a threshold.

Record the metric value and your chosen warning/critical thresholds.

Completion checklist

- Captured CPU, memory, disk-IOPS and network baselines.
- Wrote a dated baseline file for later comparison.
- Inspected event logs and confirmed rotation/retention.
- Exposed metrics with node_exporter.
- Defined threshold -> alert conditions.
