

CHEATSHEET · QUICK REFERENCE

Lab 33 — Security Troubleshooting

Audit open ports and process states, baseline file integrity with AIDE, scan with ClamAV, hunt SUID/world-writable misconfigurations and read the can't-open-file triad.

Ports and process states

```
ss -tulnp
Listening sockets vs. firewall policy

nmap -sT -p- -T4 127.0.0.1
Full local port scan

ps -eo pid,ppid,state,user,comm | awk '$3=="Z"'
Zombie (defunct) processes

ps -eo pid,ppid,user,comm | awk '$2==1 && $1!=1'
Orphans reparented to init
```

File integrity + malware

```
aideinit -y -f
Build the integrity baseline

aide --check
Detect drift after a tamper

chkrootkit | head -30
Rootkit scan

clamscan /tmp/scan/
Anti-malware scan (EICAR test)
```

Misconfiguration hunt

```
find /etc -type f -perm -o+w
World-writable files

find / -xdev \( -perm -4000 -o -perm -2000 \) -type f
SUID/SGID binaries

ls -l /proc/$PID/exe
'(deleted)' binary = tampered service
```

Can't-open-file triad

Check	Command
Filesystem perms	ls -l / getfacl
MAC policy	aa-status / sestatus
Service health	systemctl status smbd
Windows equivalent	UAC + share + NTFS ACLs
